

# Commtech Wireless Messaging Middleware Integration

## Fusion Messaging Solutions

A low cost, low maintenance, easy to manage approach to Messaging ideal for aged care sites and smaller facilities. Fusion is available in either desktop design or as a 19" Rackmount solution as a self contained device. Alarms can be received via low level outputs, serial or IP connectivity.

The Event Management Module (EMM) is the centralised hub of the innovative Fusion series. The EMM can connect together numerous other modules within the range to offer a tailored messaging solution. The "plug and play" nature of the equipment ensures that set-up and configuration of the equipment is simple and fast, while maintenance can be conducted easily, even by a remote technician logging in over the Internet. Being an embedded application server device, the Fusion series is not reliant on a PC or server environment.

## Commtech Messenger Solution

Software based large scale messaging systems designed for larger facilities. Unlimited users, recipients, inputs and outputs make Messenger the ideal messaging solution for large facilities or enterprise level event notification strategies. Messenger is a centralised hub for all alarms and alerts within a facility. Once received the alarms are filtered and processed through an advanced rule processing engine before being sent out to users of the KIRK or SpectraLink systems, providing the right message to the right person at the right time. Alarms can be received by Messenger via low level outputs, serial or IP connectivity.

Ultimately, the ability to reach mobile team members within seconds improves overall workflow, staff productivity, and the comfort and safety of everyone in your facility. Real-time delivery of important alerts to the people who can act on them not only strengthens the efficiency of your operations, but it can also save lives.

## Reporting

Both Fusion and Commtech Messenger have a comprehensive reporting feature allowing the user to dissect events after they have occurred. The user can accurately pinpoint the source of the alarms, whom it was sent to, by which method and the time scales involved.

## Examples of Vertical Markets Served:

- Healthcare – Acute Care
- Healthcare – Aged Care/Assisted Living
- Hotels and Hospitality
- Casinos and Gaming
- Retail
- Emergency Services
- Construction
- Mining, Ports, Industry
- And many more.....
- Education
- Agriculture
- Public Buildings
- Engineering
- Government
- Manufacturing
- Transportation/Logistics
- Court Houses
